The MS Center at CUMC is happy to invite you to participate in a new exercise study now enrolling at our center.

The study requires three visits at which you will take part in a stationary bicycle exercise test with an exercise physiologist.

We are interested in whether taking aspirin before exercise will allow you to exercise for longer and experience less overheating. At each visit, you will be given a pill that is either aspirin, acetaminophen, or placebo.

The total time you will spend exercising on the bike at each visit is less than 30 minutes.

If you are interested, please email: MSCenter@cumc.columbia.edu and our study coordinator will be in touch to provide more details.
